

Sensitivity of the across-study correlation to the ball radius λ

Mean over 20 replications at $n = 10,000$. Light band: mean influence-function 95% CI. Dark band: ± 1.96 Monte-Carlo SE of the mean.
Vertical dashes: interior-regime boundary $\cdot = \min p_{\cdot}(k) = 0.05$. Horizontal dashes: interior-regime closed form $\text{Corr}(\cdot, \cdot)$.
